**Evaluation**
- The UI is somewhat unintuitive. I initially had troubles figuring out what everything did. The "help" button explains the function of everything, but it's hard to figure out without it.
- The audio options are limited: You can't change the current time of the track, and it doesn't seem like you can change the sound volume.
- It's too low level. it requires knowledge of WebGL to create visualizations. I'm aiming for something that can be used by the general public.

Evaluation
- The UI is relatively easy to navigate. However, I feel like the "Digital Music Visualizer" part is annoying, as it takes up quite a large part of the screen and there isn't a way to hide it. Also, the links to the creator's social media are in the same place as the info and controls. I think the features directly related to the app should be more prominent.
- No database of other user's visualizations.
- Visualization options are rather basic (don't have much personality to them).
